OEWG TO PREPARE THE INC TO END PLASTIC POLLUTION TECHNICAL BRIEFING

HEALTH, CHEMICALS, PLASTICS & A NON-TOXIC CIRCULAR ECONOMY

Opening

Cheikh Ndiaye Sylla
Director of Ministerial Cabinet for Environment and Sustainable Development, Government of Senegal

Technical Briefing

Health, Chemicals & Plastic Materials (15 minutes)
Presentation Dr. Leonardo Trasande (Endocrine Society, Jim G. Hendrick MD Professor of Pediatrics & Director of the Center for the Investigation of Environmental Hazards, New York University Grossman School of Medicine)

New Data from Africa, Asia and Latin America (10 minutes)
Presentation by Griffins Ochieng (IPEN Plastic Working Group CoChair, Kenya)
Panel Discussion

Valentina Sierra
Permanent Mission of Uruguay to the United Nations Government of Uruguay

Damaris Carnal
Senior Policy Advisor Global Affairs Section at the Swiss Federal Office for the Environment, Government of Switzerland

Kei Ohno Woodall
Basel, Rotterdam and Stockholm (BRS) Conventions Program Officer, and Coordinator of new chemical listings in the POPR Review Committee for the Stockholm Convention and Chemical Review Committee for the Rotterdam Convention

Teeraporn Wiriwutikorn (video recording)
Deputy Director of Environmental Protection Unit, Ministry of Natural Resources and Environment, Government of Thailand
Plastics, Endocrine Disrupting Chemicals and Health

Leonardo Trasande, MD, MPP
Jim G. Hendrick, MD Professor of Pediatrics
Vice Chair for Pediatrics and Director, Division of Environmental Pediatrics
Professor of Environmental Medicine and Population Health
NYU School of Medicine
Summary

Many plastic additives are known to interfere with hormone functioning and are, by definition, endocrine disrupting chemicals.

There is clear and extensive evidence of the human health impacts of many chemicals in common plastics.

The health and economic impacts of these widely used chemicals can be profound and life threatening.
What is the Endocrine Society?

It is the world’s oldest, largest, and most active organization devoted to research on hormones and the clinical practice of endocrinology.

Its membership consists of over 18,000 scientists, physicians, educators, nurses, and students in more than 100 countries.
What are endocrine disrupting chemicals?

Endocrine disrupting chemicals (EDCs) interfere with hormonal signaling systems

- Mimic, block, or modulate the synthesis, release, transport, metabolism, binding, or elimination of natural hormones

- Brain, pituitary, gonads, thyroid, and other components of the endocrine system

Representative EDCs from diverse functional use categories. EDC=endocrine-disrupting chemical. DBP=dibutyl phthalate. DEET=N,N-diethyl-m-toluamide. DDT=dichlorodiphenyltrichloroethane. BPA=bisphenol A. PCB=polychlorinated biphenyl. PBDE=polybrominated diphenyl ether.

*Table 1: List of representative EDCs in use*
Endocrine-Disrupting Chemicals: An Endocrine Society Scientific Statement

Evantha Diamant-Kandarakis, Jean-Marie Bourguignon, Linda C. Gaudicke, Russ Hauser, Gail S. Prins, Ana M. Soto, R. Thomas Zoeller, and Andrea C. Gore
Endocrine Section of the Department of Medicine (E.S.K.), Lillooet Hospital, Medical School University of Athens, 11527 Athens, Greece; Department of Pediatrics (J.P.R.), Centre Hospitalier Universitaire de Lille, 4000 Lille, France; Department of Obstetrics, Gynecology, and Reproductive Sciences (L.C.G.), University of California San Francisco, San Francisco, California 94143; Department of Environmental Health (R.T.Z.), Harvard School of Public Health, Boston, Massachusetts 02115; Department of Urology (G.S.P.), University of Illinois at Chicago, Chicago, Illinois 60612; Department of Anatomy and Cell Biology (A.M.S.), Tufts University School of Medicine, Boston, Massachusetts 02111; Biology Department (R.L.Z.), University of Massachusetts, Amherst, Massachusetts 01003; and Division of Pharmacology and Toxicology (A.C.G.), The University of Texas at Austin, Austin, Texas 78712

There is growing interest in the possible health threat posed by endocrine-disrupting chemicals (EDCs), which are substances in our environment, food, and consumer products that interfere with normal hormonal functions. EDCs are found in the environment, including food, and may have adverse effects on health. In this first Scientific Statement of the Endocrine Society, we present the evidence that endocrine disruptors have effects on male and female reproduction, breast development and cancer, prostate cancer, neuroendocrinology, thyroid, metabolism and obesity, and cardiovascular endocrinology. Results from animal models, human clinical observations, and epidemiological studies converge to implicate EDCs as a significant concern to public health. The mechanisms of EDCs involve divergent pathways including (but not limited to) estrogenic, androgenic, thyroid, peroxisome proliferator-activated receptor γ, retinoid, and actions through other nuclear receptors: sterologenic enzymes; neurotransmitter receptors and systems; and many other pathways that are highly conserved in wildlife and humans, and which can be modeled in laboratory in vitro and in vivo models. Furthermore, EDCs represent a broad class of molecules such as organochlorinated pesticides and industrial chemicals, plastics and plasticizers, fuels, and many other chemicals that are present in the environment or are in widespread use. We make a number of recommendations to increase understanding of effects of EDCs, including enhancing increased basic and clinical research, involving the precautionary principle, and advocating involvement of individual and scientific society stakeholders in communicating and implementing changes in public policy and awareness. (Endocrine Reviews 30: 293–342, 2009)

The Endocrine Society’s Second Scientific Statement on Endocrine-Disrupting Chemicals

Pharmacology and Toxicology (A.C.G.), College of Pharmacy, The University of Texas at Austin, Austin, Texas 78713; Division of the National Toxicology Program (A.A.C., S.T.F.); National Institute of Environmental Health Sciences, National Institutes of Health, Research Triangle Park, North Carolina 27709; Department of Comparative Biosciences (A.T.P.), University of Illinois at Urbana-Champaign, Urbana, Illinois 61801; Institute of Bioengineering and BioBMED (M.N.), Miguel Hernández University of Elche, 03202 Elche, Alicante, Spain; Departments of Urology, Pathology, and Physiology & Biochemistry (G.S.P.), College of Medicine, University of Illinois at Chicago, Chicago, Illinois 60612; Departments of Physiology and Pediatrics (J.T.), University of Turku and Turku University Hospital, 20520 Turku, Finland; and Biology Department (R.T.Z.), University of Massachusetts at Amherst, Amherst, Massachusetts 01003

The Endocrine Society’s First Scientific Statement in 2009 provided a wake-up call to the scientific community about how environmental endocrine-disrupting chemicals (EDCs) affect health and disease. Five years later, a substantially larger body of literature has solidified our understanding of plausible mechanisms underlying EDC actions and how exposures in animals and humans—especially during development—may lay the foundations for disease later in life. At this point in history, we have much stronger knowledge about how EDCs alter gene-environment interactions via physiological, cellular, molecular, and epigenetic changes, thereby producing effects in exposed individuals as well as their descendants. Causal links between exposure and manifestation of disease are substantiated by experimental animal models and are consistent with correlative epidemiological data in humans. There are several caveats because differences in how experimental animal work is conducted can lead to difficulties in drawing broad conclusions, and we must continue to be cautious about inferring causality in humans. In this second Scientific Statement, we reviewed the literature on a subset of topics for which the translational evidence is strongest: 1) obesity and diabetes; 2) female reproduction; 3) male reproduction; 4) hormone-sensitive cancers in females; 5) prostate; 6) thyroid; and 7) neurodevelopment and neuroendocrine systems. Our inclusion criteria for studies were those conducted predominantly in the past 5 years deemed to be of high quality based on appropriate negative and positive control groups or populations, adequate sample size and experimental design, and mammalian animal studies with exposure levels in a range that was relevant to humans. We also focused on studies using the developmental origins of health and disease model. No report was excluded based on a positive or negative effect of the EDC exposure. The bulk of the results across the board strengthen the evidence for endocrine health-related actions of EDCs. Based on this much more complete understanding of the endocrine principles by which EDCs act, including nonmonotonic dose responses, low-dose effects, and developmental vulnerability, these findings can be much better translated to human health. Armed with this information, researchers, physicians, and other healthcare providers can guide regulators and policymakers as they make responsible decisions. (Endocrine Reviews 36: 0000–0000, 2015)
Mainstream recognition

Endocrine-disrupting chemicals and obesity risk: A review of recommendations for obesity prevention policies

Tim Lobstein, Kelly D. Brownell

World Obesity Federation, London, UK

Summary
Emerging evidence indicates that industrially produced endocrine-disrupting chemicals (EDCs) may be as obesogenic as poor dietary patterns and should be considered in obesity prevention policies. The authors conducted two reviews: (a) a systematic search of four electronic databases for papers published since January 2010 to identify the policy recommendations contained in scientific reviews of EDC exposure and obesity risk and (b) a narrative review of obesity policy documents published since January 2012 to identify the recommendations of national and international agencies. A search of four electronic databases found 63 scientific reviews with policy recommendations, of which 26 suggested individual responsibility to avoid exposure, 11 suggested medical interventions to counter the effects of exposure, and 42 suggested regulatory control of hazardous chemicals. Of sixty policy documents examined, six mentioned pollutants as a possible risk factor for obesity, and only one made explicit reference to strategies for reducing exposure to EDCs. The UN Sustainable Development Goals include targets to prevent ill health from hazardous chemicals (Targets 3.9 and 12.4) and to remove unsafe industrial chemicals from the environment (Targets 6.3, 11.6, 12.4, and 14.1). The authors suggest these should be explicitly linked to World Health Assembly targets to halt the rise in obesity.
Plastics are a crucial source of EDCs

Bisphenols (polycarbonate plastics, aluminum can linings)

Phthalates (food packaging)

Per- and polyfluoroalkyl substances (PFAS, nonstick cooking and fluoropolymer plastics)

Brominated flame retardants (additives to reduced flammability)

Burning plastics → dioxins
Endocrine disruption and the developing brain

Thyroid hormone has long been known to be critical to early brain development

- Predictable outcomes of its disruption: IQ deficits, autism spectrum disorder (ASD), and attention-deficit hyperactivity disorder (ADHD).
- Brominated flame retardants have chemical structure similar to thyroid hormone itself (may directly inhibit its function and reduce its production).
Brominated flame retardants

Four well-designed longitudinal birth cohorts have examined PBDE effects on child neurodevelopment

• Three (all US) identified consistent, exposure-response relationships with IQ, with carefully collected data on many potential confounders.

  Chen et al EHP 2014; Eskenazi et al EHP 2013; Herbstman et al EHP 2010

• Fourth (from Spain), despite modest sample size with few detectable PBDE levels, showed substantial directionality towards cognitive and motor dysfunction at age 4.

  Gascon et al Environment International 2011

[^60-63]: Increased fat cell differentiation.  
[^82,83]: Estrogenic properties.  
[^86]: Inhibition of neural progenitor cell proliferation.  
[^105]: Increased rate of adipogenesis.  
[^106]: Increased glucose intolerance.  
[^56,101]: Altered thyroid function.  
[^112]: Altered metabolism.  
[^109]: Bioaccumulation in fat cells.  
[^117,120-122]: Increased adipocyte differentiation.
Bisphenols

Used in polycarbonate plastics and epoxy resins (aluminum cans, thermal paper receipts)

Experimental studies suggest that bisphenol A disrupts multiple metabolic mechanisms, at levels commonly seen in US population

- Increases fat cell size, disrupts adiponectin function and low-grade synthetic estrogen

As concern has increased, ~40 chemically similar replacements now in use: bisphenol S (BPS), BPF, BPAF, BPZ, BPP…

- BPS: similar estrogenicity, embryotoxicity (potentially others)

Phthalates

Low-molecular weight (LMW) phthalates used in shampoos, cosmetics, lotions and other personal care products to preserve scent

- Anti-androgenic properties (reduced transcription of the androgen receptor)

High molecular weight (HMW) phthalates used to produce vinyl plastic for flooring, clear food wrap and intravenous tubing.

- Mono-(2-ethylhexyl) phthalate (MEHP), a metabolite of one HMW phthalate used in food packaging, di-2-ethylhexylphthalate (DEHP), increases expression of three peroxisome proliferator-activated receptors (PPARs) which play key roles in lipid and carbohydrate metabolism

Bornehag and Nanberg 2010; Colon et al. 2000; Engel et al. 2010; Miodovnik et al. 2011; Sathyanarayana 2008; Swan 2008; Swan et al. 2005; Desvergne et al. 2009, Grun and Blumberg 2007, Philips et al Repro Tox 2019
BPA → cardiovascular mortality

BPA associated with:
• reduced carotid intima-media thickness of 12-30 and >70 year olds
  Lin et al Atherosclerosis 2015, Lind et al Atherosclerosis 2011)
• BPA associated with severity of coronary artery disease in angiography
  Melzer et al PLOS One 2012
• Reduced heart rate variability in adults
  Bae et al Hypertension 2012
• All-cause mortality, and cardiovascular disease mortality
  Bao et al JAMA Network Open 2020
Phthalates \(\rightarrow\) cardiovascular mortality

Low T either predictor of or marker of cardiovascular mortality in adult men

High molecular weight phthalates were associated with lower total, free, and bioavailable testosterone among men age \(\geq 60\).

Attina et al Lancet Diab Endo 2016; Hauser et al JCEM 2015

High molecular weight phthalates associated with all-cause mortality, and cardiovascular disease mortality

- Extrapolating to the population of 55-64 year old Americans, 90,761-107,283 attributable deaths and $39.9-47.1 billion in lost economic productivity.

Trasande et al Env Pollution 2021
Per- and polyfluoroalkyl substances (PFAS)

Synthetic organic fluorinated compounds with high stability and thermal resistance

- Detectable in blood of >98% of the population.
- Food packaging is a major route of exposure (nonstick cooking, microwaveable popcorn bags)
PFASs restrict fetal growth and increase childhood obesity

Meta-analysis of 24 studies: $-10.5\, \text{g} \ (95\% \ CI: -16.7, -4.4)$ birth weight per ng/ml increase in maternal or cord blood PFOA

Steenland et al Epidemiology 2018

Meta-analysis of 10 studies: 25% increase in childhood overweight and 0.10 unit increase in BMI z-score per ng/mL PFOA in maternal blood

Liu et al 2018
PFAS contribute to adult weight gain/diabetes

Diabetes Prevention Program lifestyle intervention trial:
• Total PFAS were associated with increased weight gain exclusively among the control group.  
  Cardenas et al 2018

Follow-up of the successful POUNDS LOST trial:
• Perfluorooctane sulfonate (PFOS) and perfluorononanoic acid (PFNA), were associated with reductions in resting metabolic rate.  
  Liu et al 2018

PIVUS (Sweden), Nurses (US), DPPOS (US):
• PFAS associated with incident diabetes  
Phthalates and other EDCs in plastic reduce fertility

Fertility is a condition of a couple, where reproductive health of both sexes plays a role

Fetal exposure to phthalates with reduced infant anogenital distance (AGD)
• Shortened adult AGD is associated with reduced semen quality and testosterone level

Multiple studies have identified reduced male fertility and poor semen quality with multiple EDCs, including phthalates, bisphenol A, and polyfluorinated chemicals

Louis et al 2013
Swan et al EHP 2005, Bornehag et al EHP 2014
Juul et al Nat Rev Endo 2014
What is the burden of disease burden and are the health costs due to EDCs?

Expert panels identified conditions where the evidence is strongest for causation

• Developed ranges for fractions of disease burden that can be attributed for EDCs

• Adapted GRADE Working Group and WHO criteria for evaluating Adapted IPCC approach to integrate epidemiology and toxicology evidence and estimate probability of causation
HEALTH EFFECTS FROM ENDOCRINE DISRUPTING CHEMICALS COST THE EU 157 BILLION EUROS EACH YEAR. This is the tip of the iceberg: Costs may be as high as €270B.

€157B Cost by Health Effect

- Male Reproductive Disorders: 4
- Premature Death: 6
- Obesity & Diabetes: 15
- Neurological Impacts (including ADHD): 132

NOTE: The economic estimates do not include all costs associated with these conditions.

€157B Cost by EDC Type

- Pesticides: 120
- Plastic: Phthalates & BPA: 26
- Flame Retardants: 9
- Other: 2

SOME EDC-RELATED HEALTH OUTCOMES NOT INCLUDED:
- Breast Cancer
- Prostate Cancer
- Immune Disorders
- Female Reproductive Disorders
- Liver Cancer
- Parkinson’s Disease
- Osteoporosis
- Endometriosis
- Thyroid Disorders

SOME EDCs NOT INCLUDED:
- Atrazine
- 2,4-D
- Styrene
- Toluene
- Nonylphenol
- Polycyclic Aromatic Hydrocarbons
- Bisphenol S
- Cadmium
- Arsenic
- Ethylene glycol

Endocrine Disrupting Chemicals (EDCs) interfere with hormone action to cause adverse health effects in people.

“THE TIP OF THE ICEBERG”
The data shown to the left are based on fewer than 5% of likely EDCs. Many EDC health conditions were not included in this study because key data are lacking. Other health outcomes will be the focus of future research.

Attina et al Lancet Diab Endo 2016
Global costs of EDCs

Likely similar as industrializing nations become predominant consumers and producers of chemicals as expected by OECD by 2030

Data from 70 countries suggest exposure to PFOA contributed to approximately 461,635 (95% CI: 57,418-854,645) cases per year of LBW during the past two decades

• Predominantly from Asian regions
Summary

Many plastic additives are known to interfere with hormone functioning and are, by definition, endocrine disrupting chemicals.

There is clear and extensive evidence of the human health impacts of many chemicals in common plastics.

The health and economic impacts of these widely used chemicals can be profound and life threatening.
